Primordial universe

# THE EARLY UNIVERSE

by GUILLEM DOMÈNECH

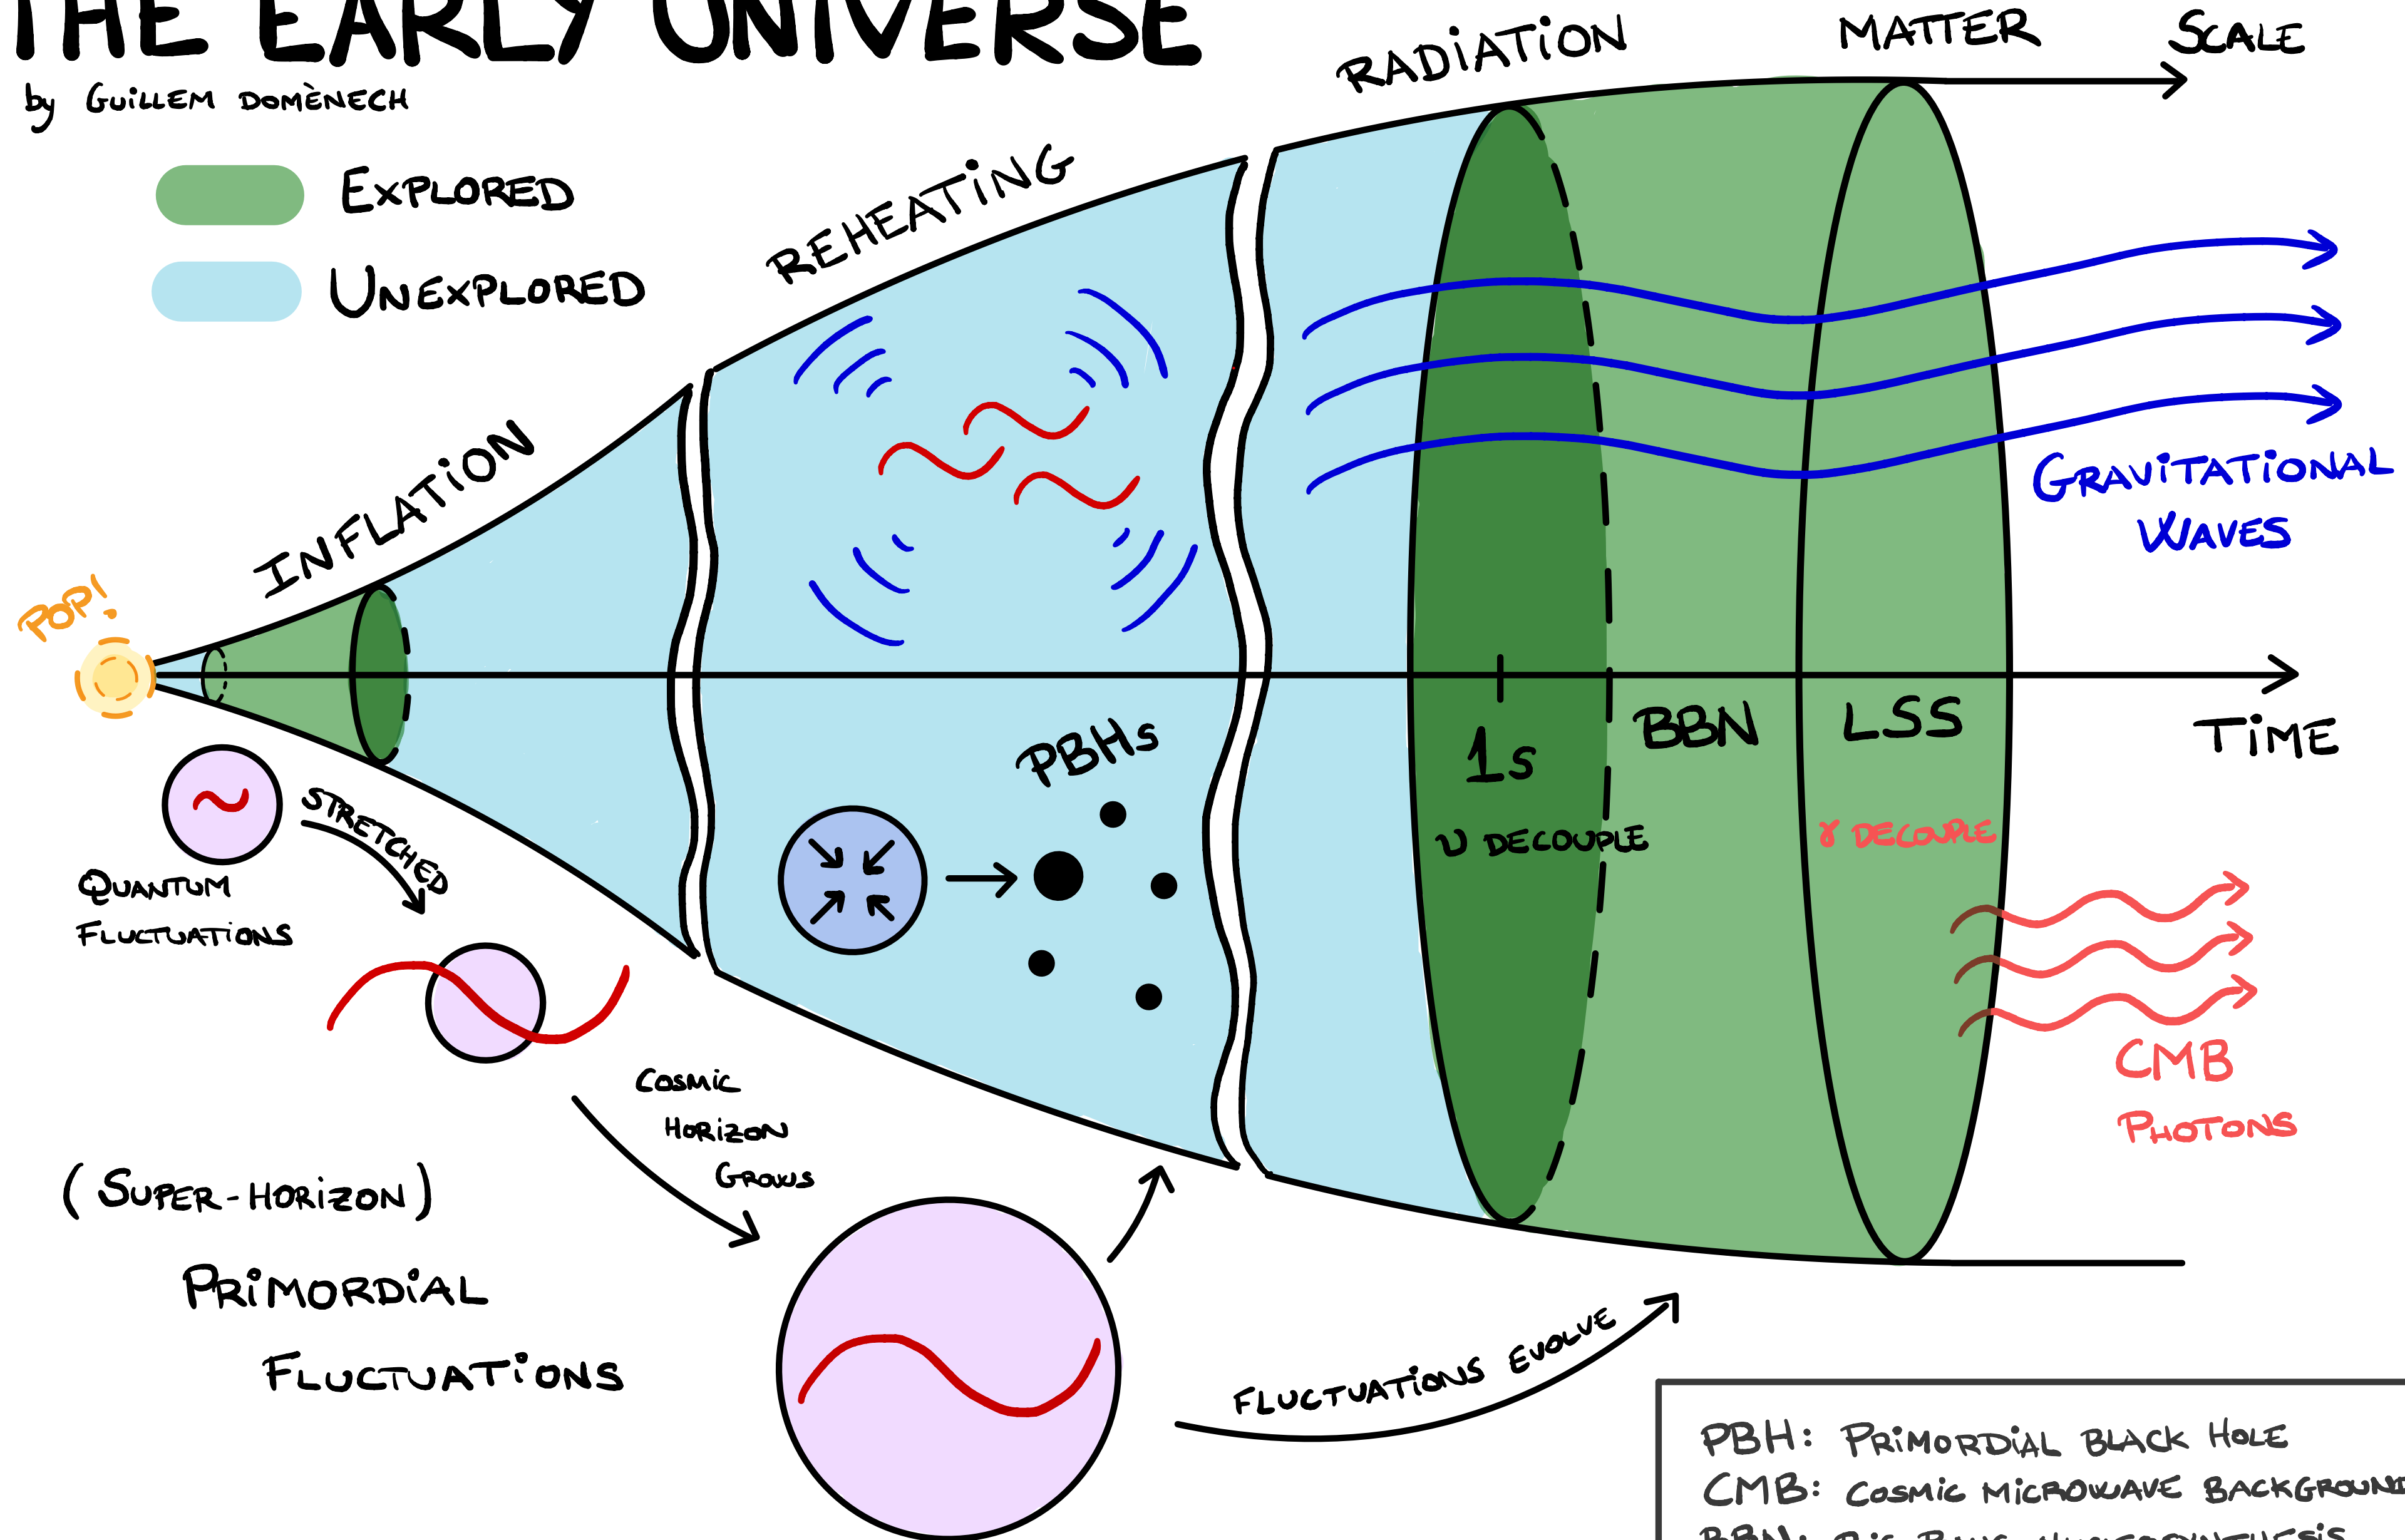

Image from: <https://domenechcosmo.netlify.app/post/induced-gws/>

# General (ambitious) questions

- What is **dark matter**? Particles or (Primordial) **Black Holes**?
- How can we further test **cosmic inflation** and **gravity**?
- (New) **gravitational waves probes**: all BHs astrophysical? **PTAs**?
- How can we test beyond SM physics in the very early universe?  
For  **$T > 4 \text{ MeV}$**  we are not so sure.

# Why care?

We will be probing **unexplored regimes**:

Inflation, reheating, ...

Expected **astrophysical** signals but maybe **cosmological** too!

**New tests** of **gravity** and **particle physics**  
at extremely high energies

Phase transitions,  
cosmic strings, axions, ...

Take note!

**Good for astrophysics too!**

Exhausting all possible cosmic GW spectra  
=  
Only a "clean" astrophysical signal

# Primordial black holes are nice!

[Review: Sasaki+1801.05235]

Candidates for:

dark matter, some of LIGO BH mergers, seeds of SMBH, OGLE planet mass BH, etc.

Most common mechanism: **collapse of large primordial fluctuations**

[Carr & Hawking 1974]

**Connection to (or test of)  
cosmic inflation**

**Predicts (nice) observable  
GW signal (induced GWs)**

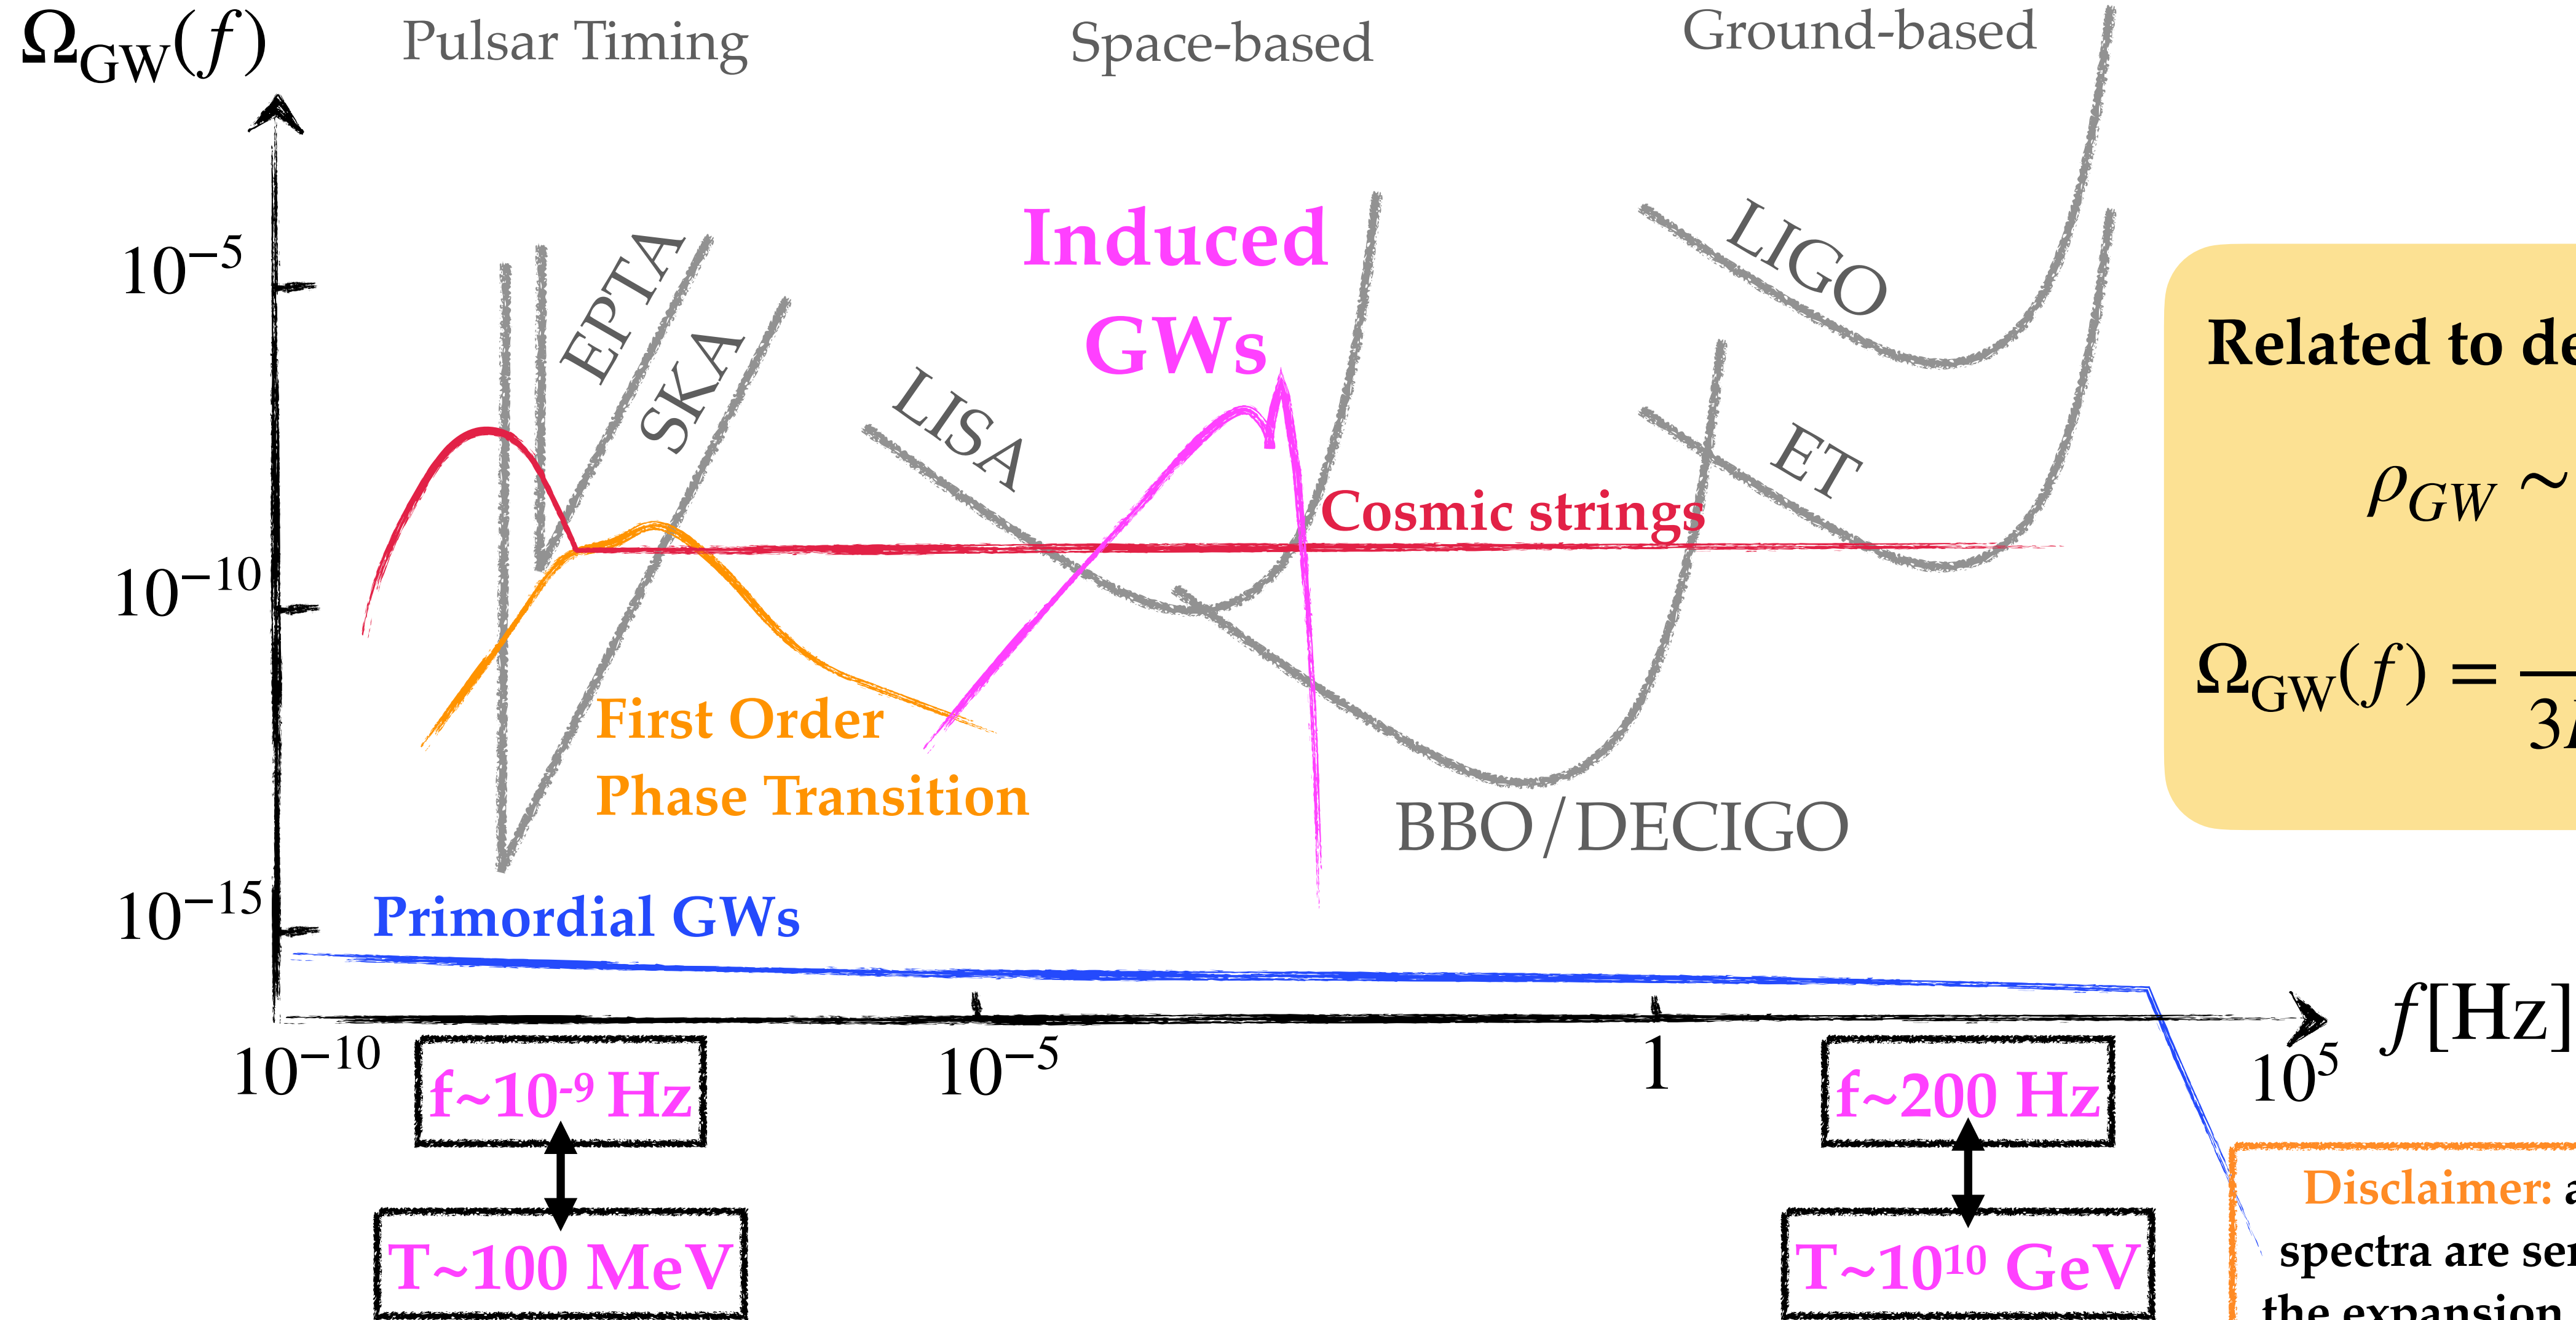

[Review: Domènech 2109.01398]

PBH may also form by long-range Yukawa interactions in the early universe... [Domènech+2304.13053]

# Gravitational wave (primordial) cosmology

For more see e.g.  
 Guzzetti+1605.01615  
 Caprini+1801.04268  
 Kuroyanagi+1807.00786

Related to detector noise

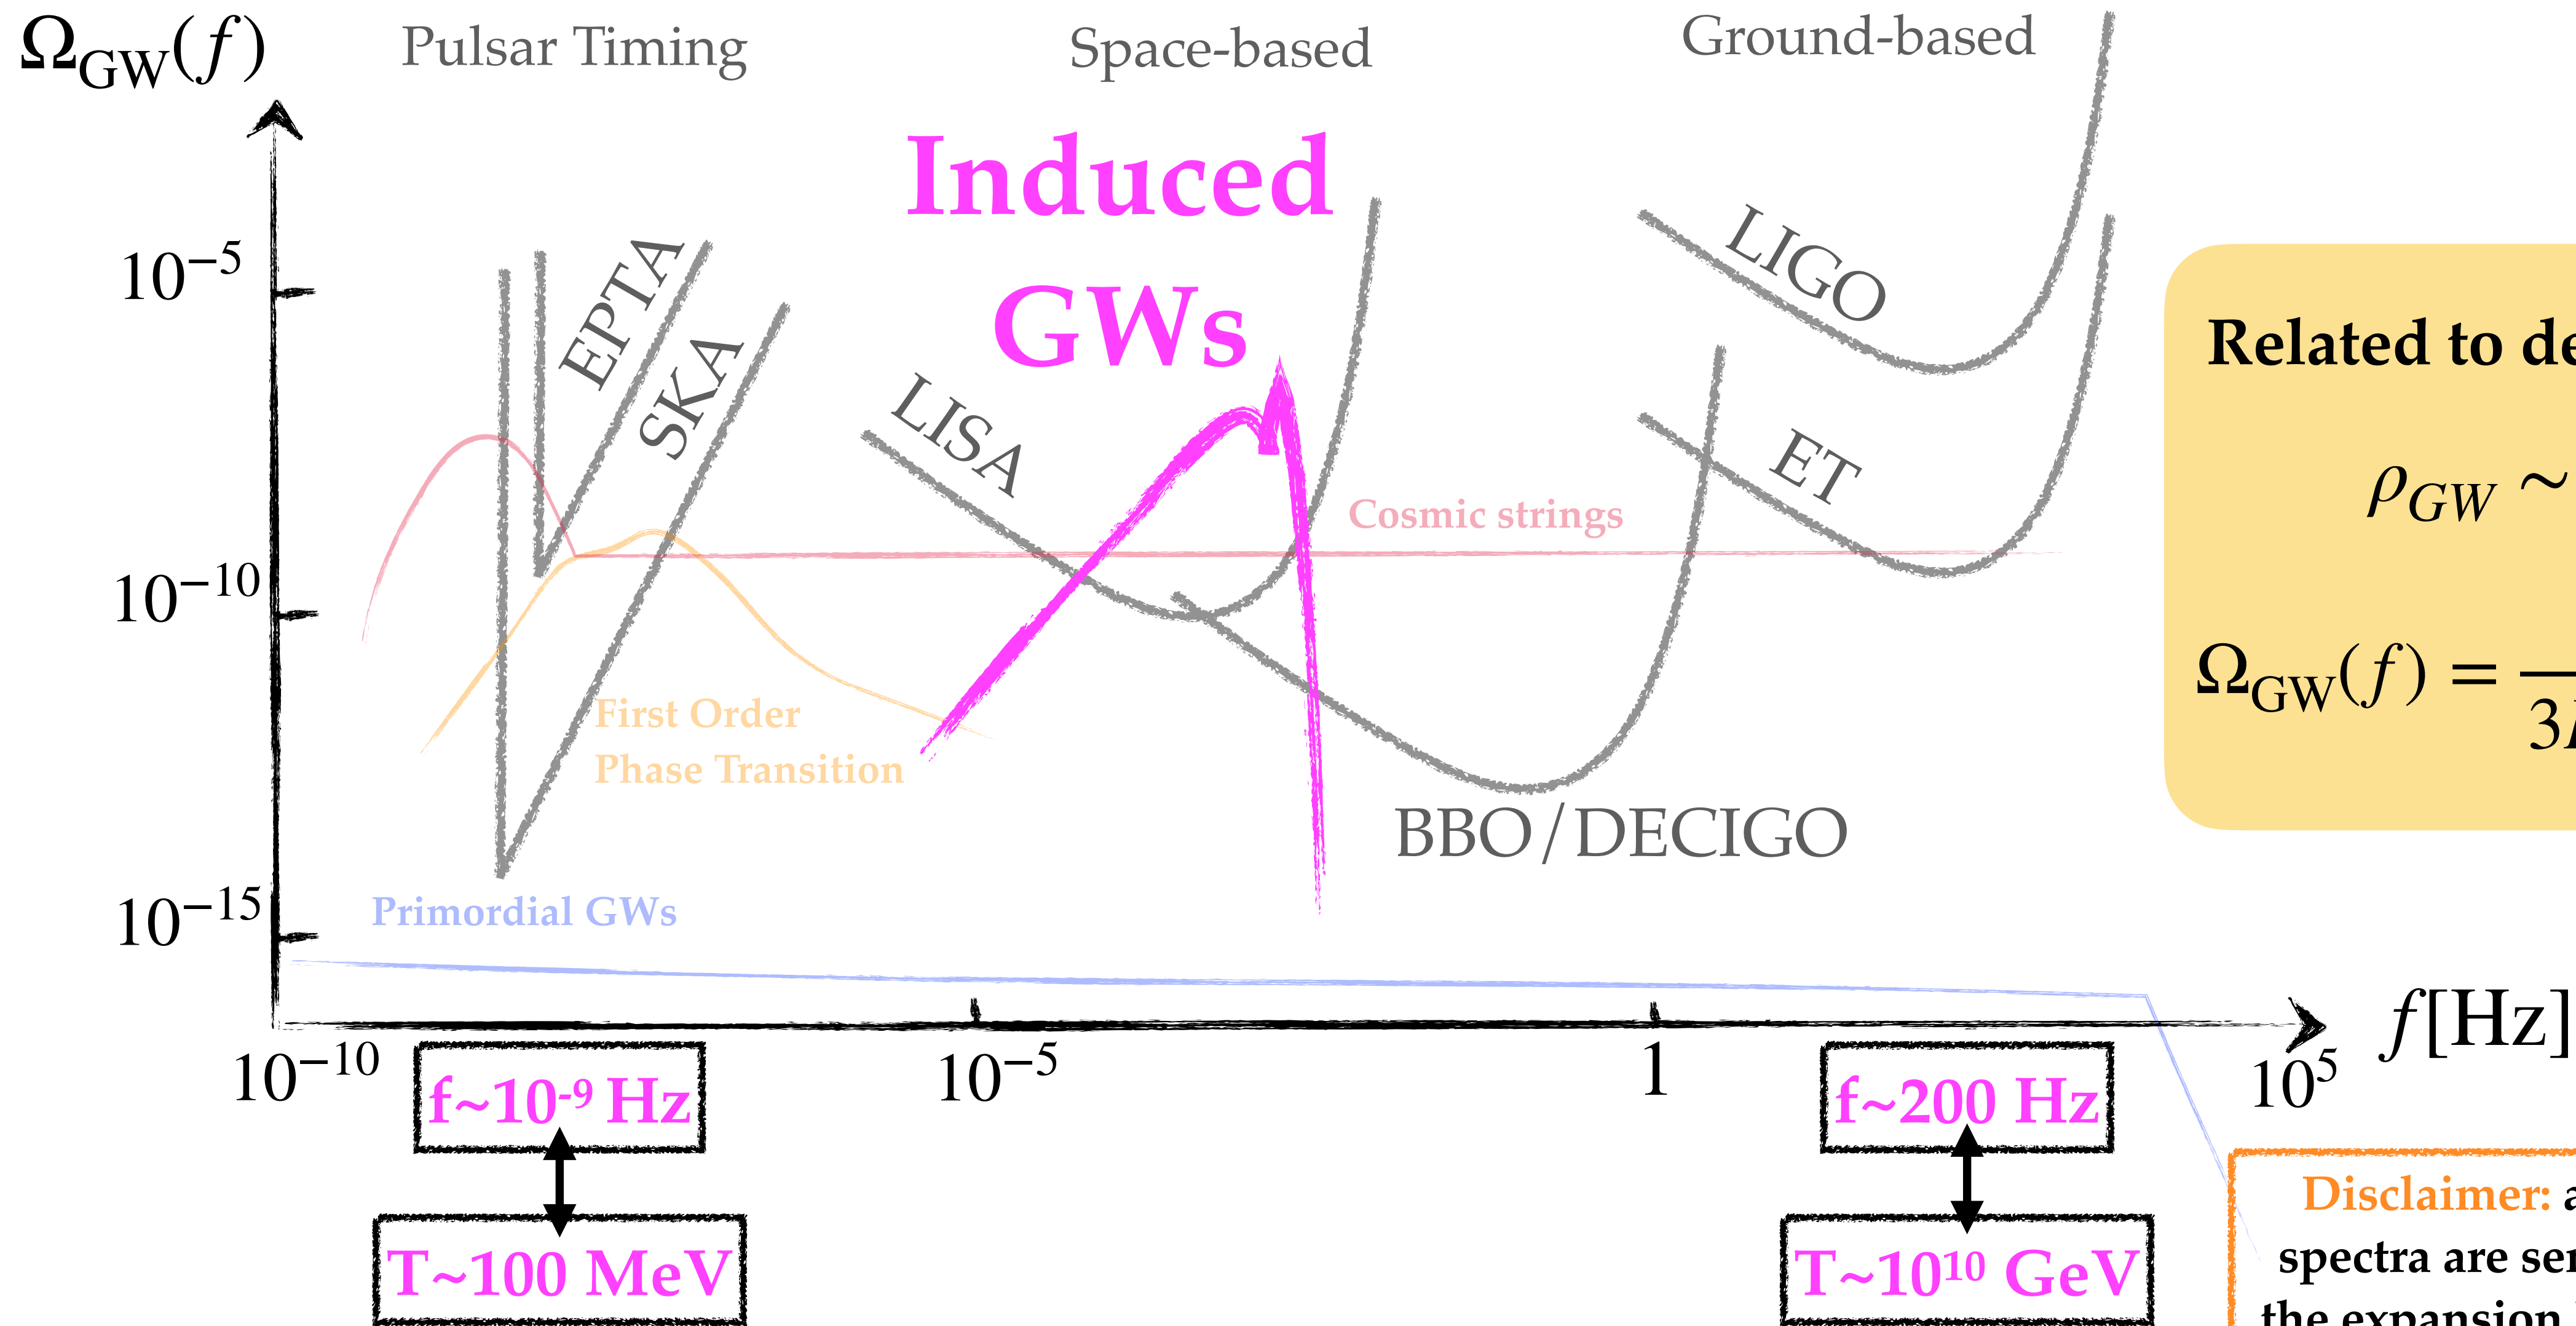

$$\rho_{\text{GW}} \sim \langle \dot{h}_{ij} \dot{h}^{ij} \rangle$$

$$\Omega_{\text{GW}}(f) = \frac{1}{3H_0^2 M_{\text{pl}}^2} \frac{d\rho_{\text{GW}}}{d \ln f}$$

**Disclaimer:** all these spectra are sensitive to the expansion history of the early universe

# Gravitational wave (primordial) cosmology

For more see e.g.  
 Guzzetti+1605.01615  
 Caprini+1801.04268  
 Kuroyanagi+1807.00786

Related to detector noise

$$\rho_{GW} \sim \langle \dot{h}_{ij} \dot{h}^{ij} \rangle$$

$$\Omega_{GW}(f) = \frac{1}{3H_0^2 M_{pl}^2} \frac{d\rho_{GW}}{d \ln f}$$

**Disclaimer:** all these spectra are sensitive to the expansion history of the early universe

induced GWs**

# Induced GWs history

- First pointed out by K. Tomita in 1971 [*Prog. Theor. Phys.* 45, 1747 (1971)]
- Followed by Matarrese, Pantano, Saez in 1993 [*Phys.Rev.Lett.* 72 (1994) 320-323]
- Also Matarrese, Mollerach, Bruni in 1997 [*Phys.Rev.D* 58 (1998) 043504]
- Then Ananda, Clarkson and Wands in 2006 [gr-qc/0612013]
- And Baumann, Ichiki, Steinhardt and Takahashi in 2007 [hep-th/0703290]
- Saito and Yokoyama in 2008: **induced GWs  $\Leftrightarrow$  PBHs!** [0812.4339]
- ...After the first LIGO detection the publication number keeps growing!

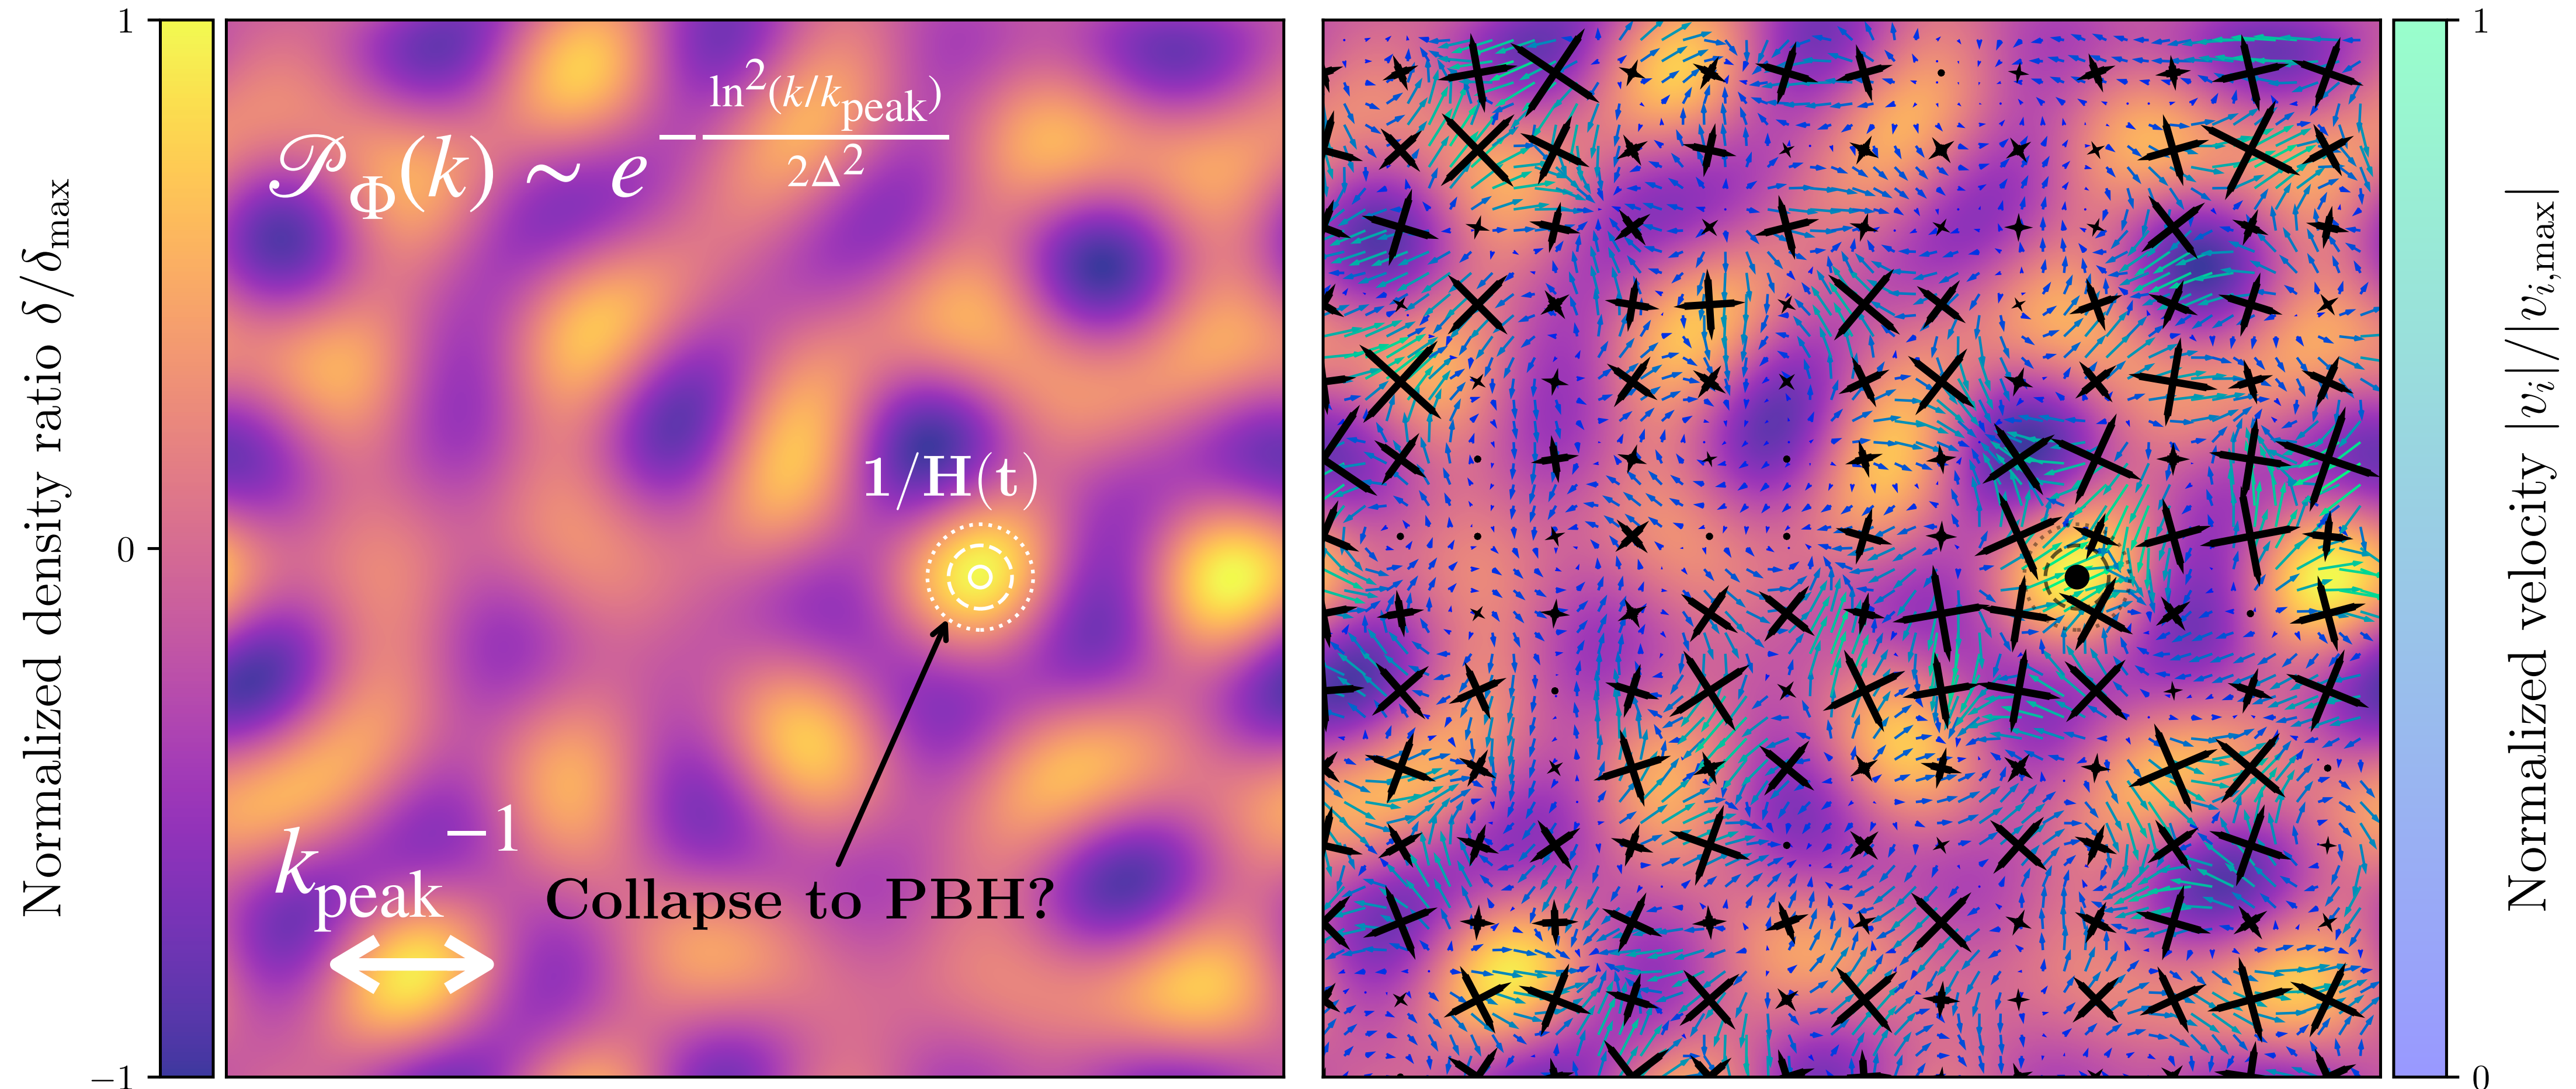

# Secondary GWs

$$h''_{ij} + 2\mathcal{H}h'_{ij} - \Delta h_{ij} = \left[ 4\partial_i\Phi\partial_j\Phi + 2a^2(\rho + P)v_iv_j \right]^{\text{TT}}$$

Primordial fluctuations

“Source” of induced GWs

Primordial fluctuations

“Source” of induced GWs

2. Induced GWs are messengers of the unexplored universe

3. Primordial Black Holes are related to induced GWs

# GWs and PBHs from primordial curvature fluctuations

$\log_{10}[X]$

# Order of magnitude estimate

After inflation: 1st order: Free wave propagating  $(\partial_t^2 + 3H\partial_t - \Delta)h_{ij} = 0$  Curvature perturbation

2nd order: Massless field with source  $(\partial_t^2 + 3H\partial_t - \Delta)h_{ij} \sim \widehat{TT}_{ij}{}^{ab} (\partial_a \Phi \partial_b \Phi)$

Energy density of GWs  $\rho_{GW} \sim \langle \dot{h}_{ij} \dot{h}^{ij} \rangle$

$$\Omega_{GW}(k) = \frac{1}{3H^2 M_{pl}^2} \frac{d\rho_{GW}}{d \ln k} = \frac{k^2}{12\mathcal{H}^2} \mathcal{P}_h(k, \tau)$$

$$\Omega_{GW}^{\text{induced}} \sim \frac{1}{12} \Omega_{r,0} \mathcal{P}_{\mathcal{R}}^2 \sim 10^{-6} \mathcal{P}_{\mathcal{R}}^2 (k \gg k_{\text{CMB}})$$

Density ratio of radiation today  $\Omega_{r,0} \sim 4 \times 10^{-5}$

Good estimate for GW spectrum's peak amplitude in radiation domination

# Order of magnitude estimate

Power-law integrated sensitivity curves: Thrane & Romano 1310.5300

# The PBH dominated universe

$$t_f \approx \frac{1}{2H_f} \approx 10^{-8} \text{qs} \left( \frac{M_{\text{PBH},f}}{1 \text{ g}} \right)$$

$$t_{\text{eeq}} \sim \beta^{-2} t_f$$

$$t_{\text{eva}} \approx 400 \text{qs} \left( \frac{M_{\text{PBH},f}}{1 \text{ g}} \right)^3$$

# The PBH dominated universe

## Two free parameters

**What initial mass?**  $M_{\text{PBH},f} \approx 10^{-5} \text{ g} \times \frac{M_{\text{pl}}}{H_f}$

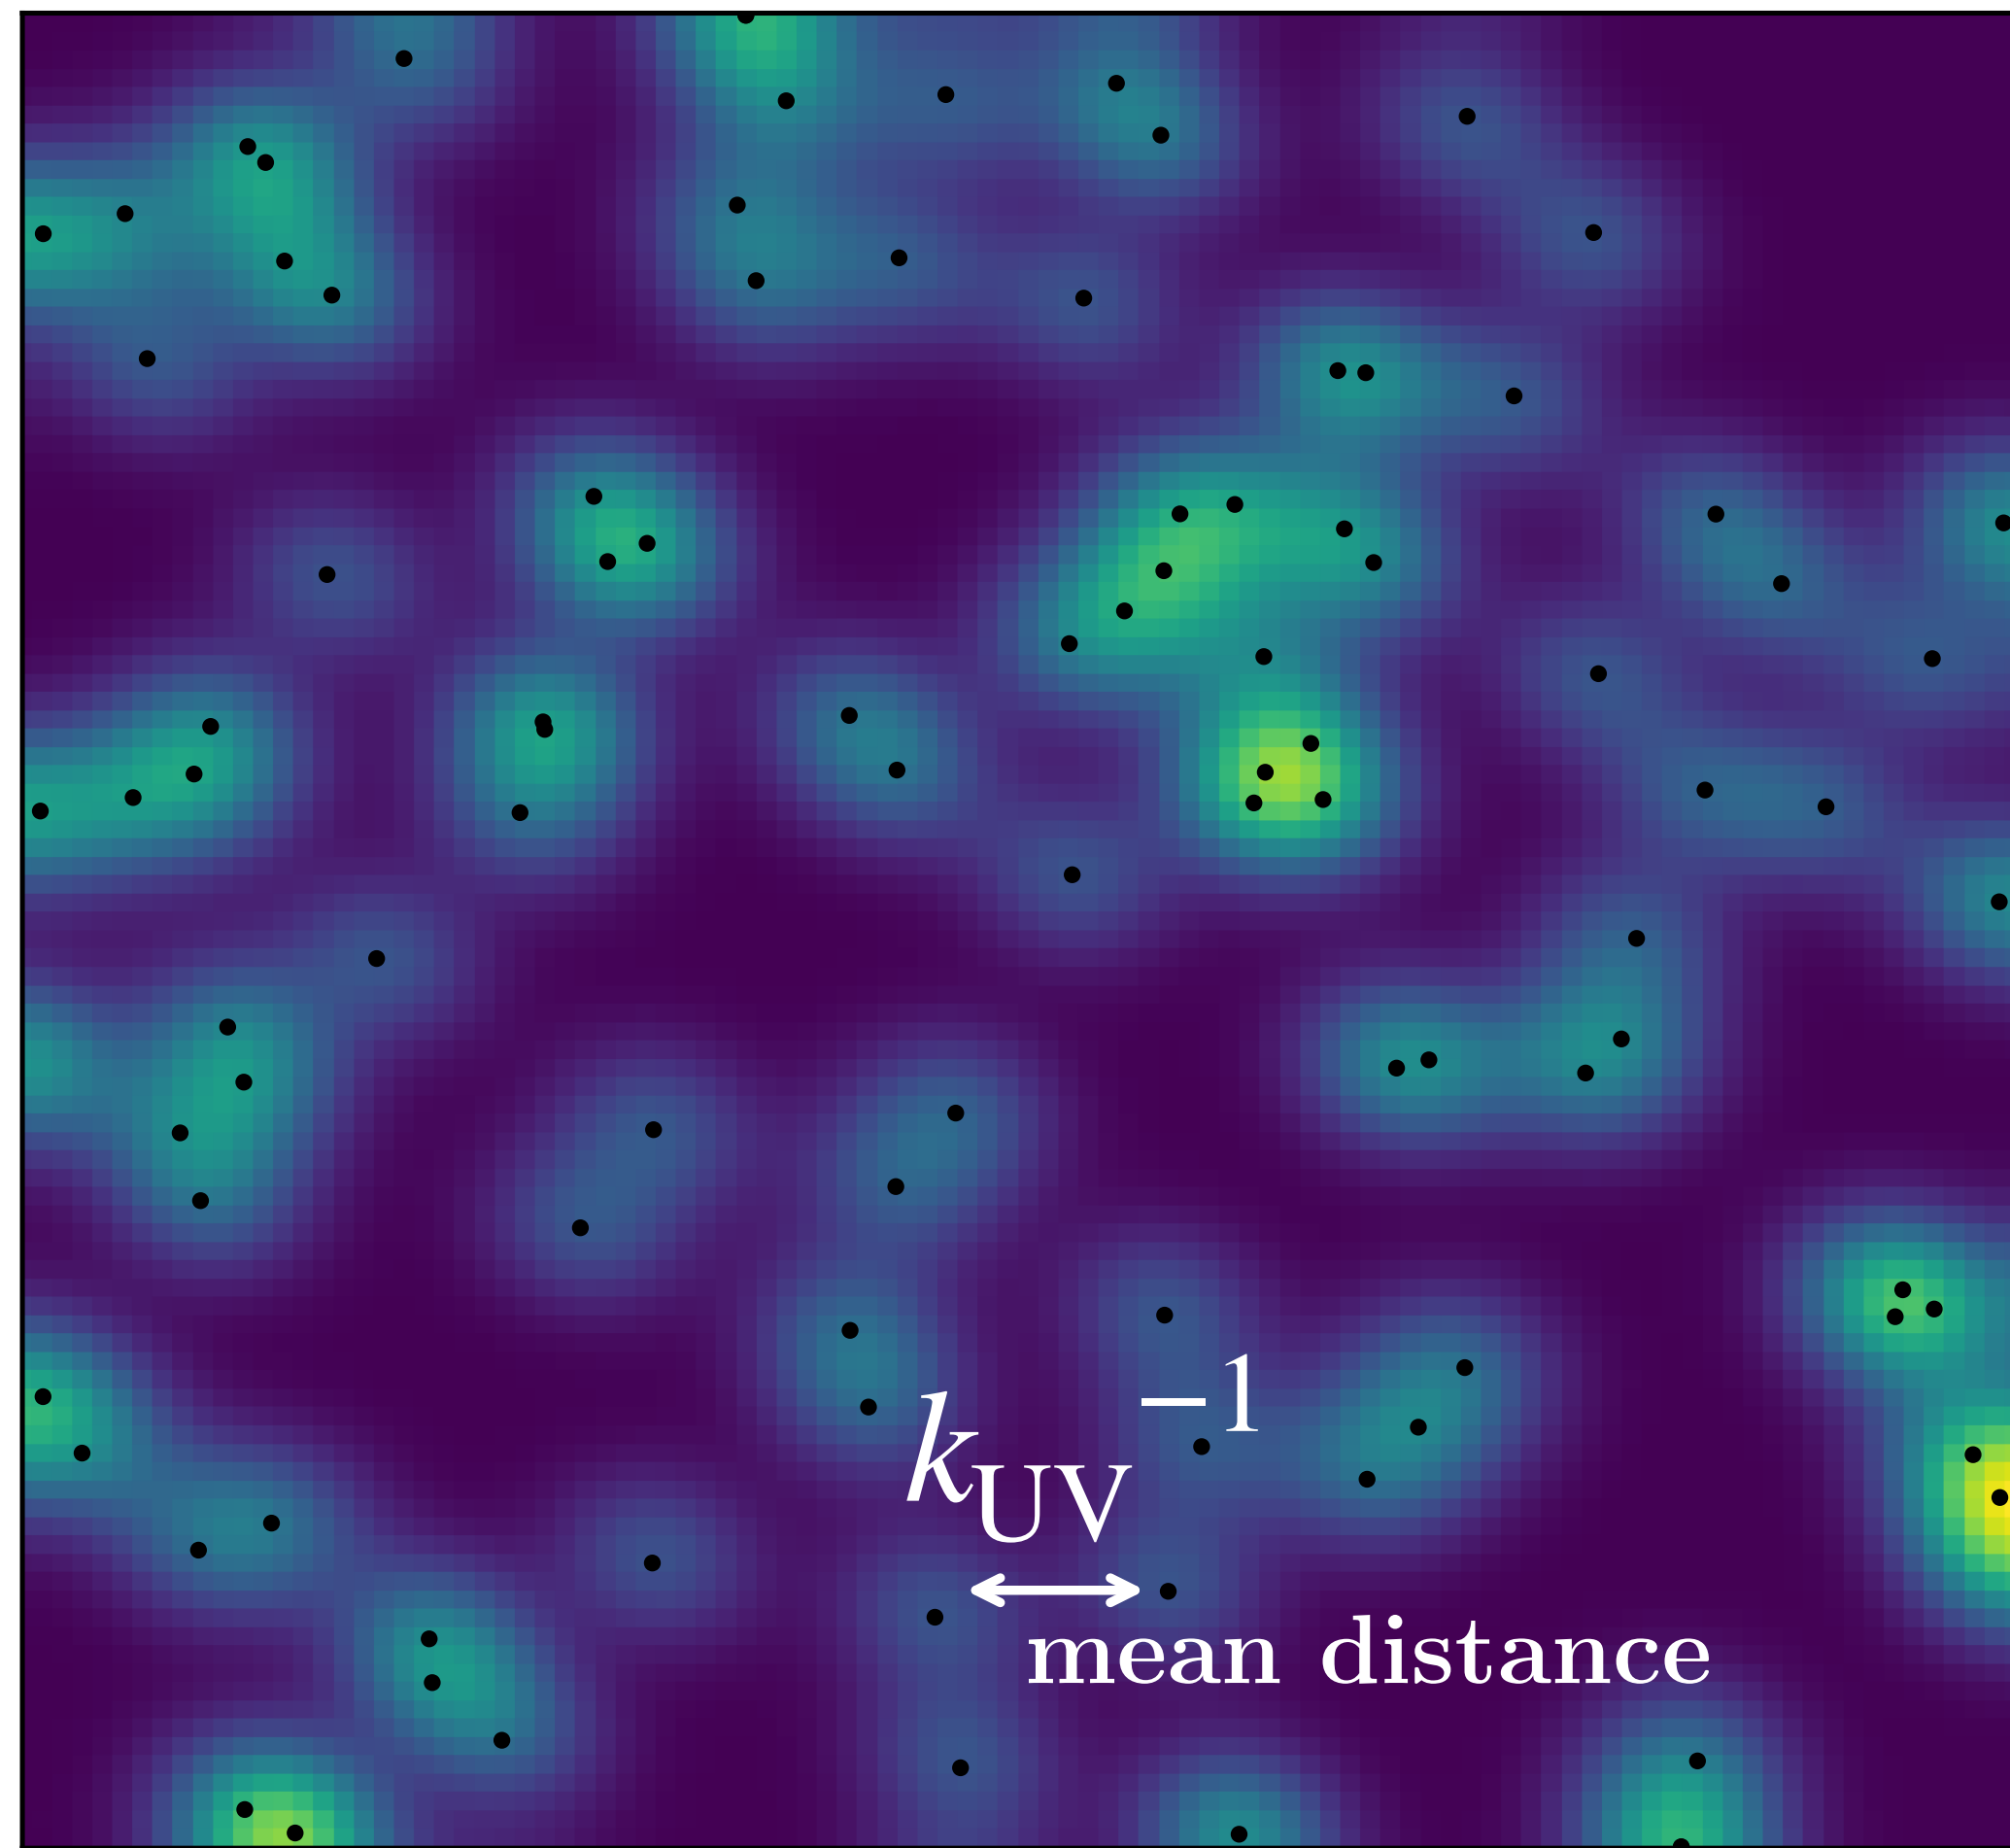

**How long until BH evaporate?**  $R_{\text{eva}} = t_{\text{eva}}/t_f$

**What initial fraction?**  $\beta_f = \frac{\rho_{\text{PBH},f}}{\rho_{\text{rad},f}}$

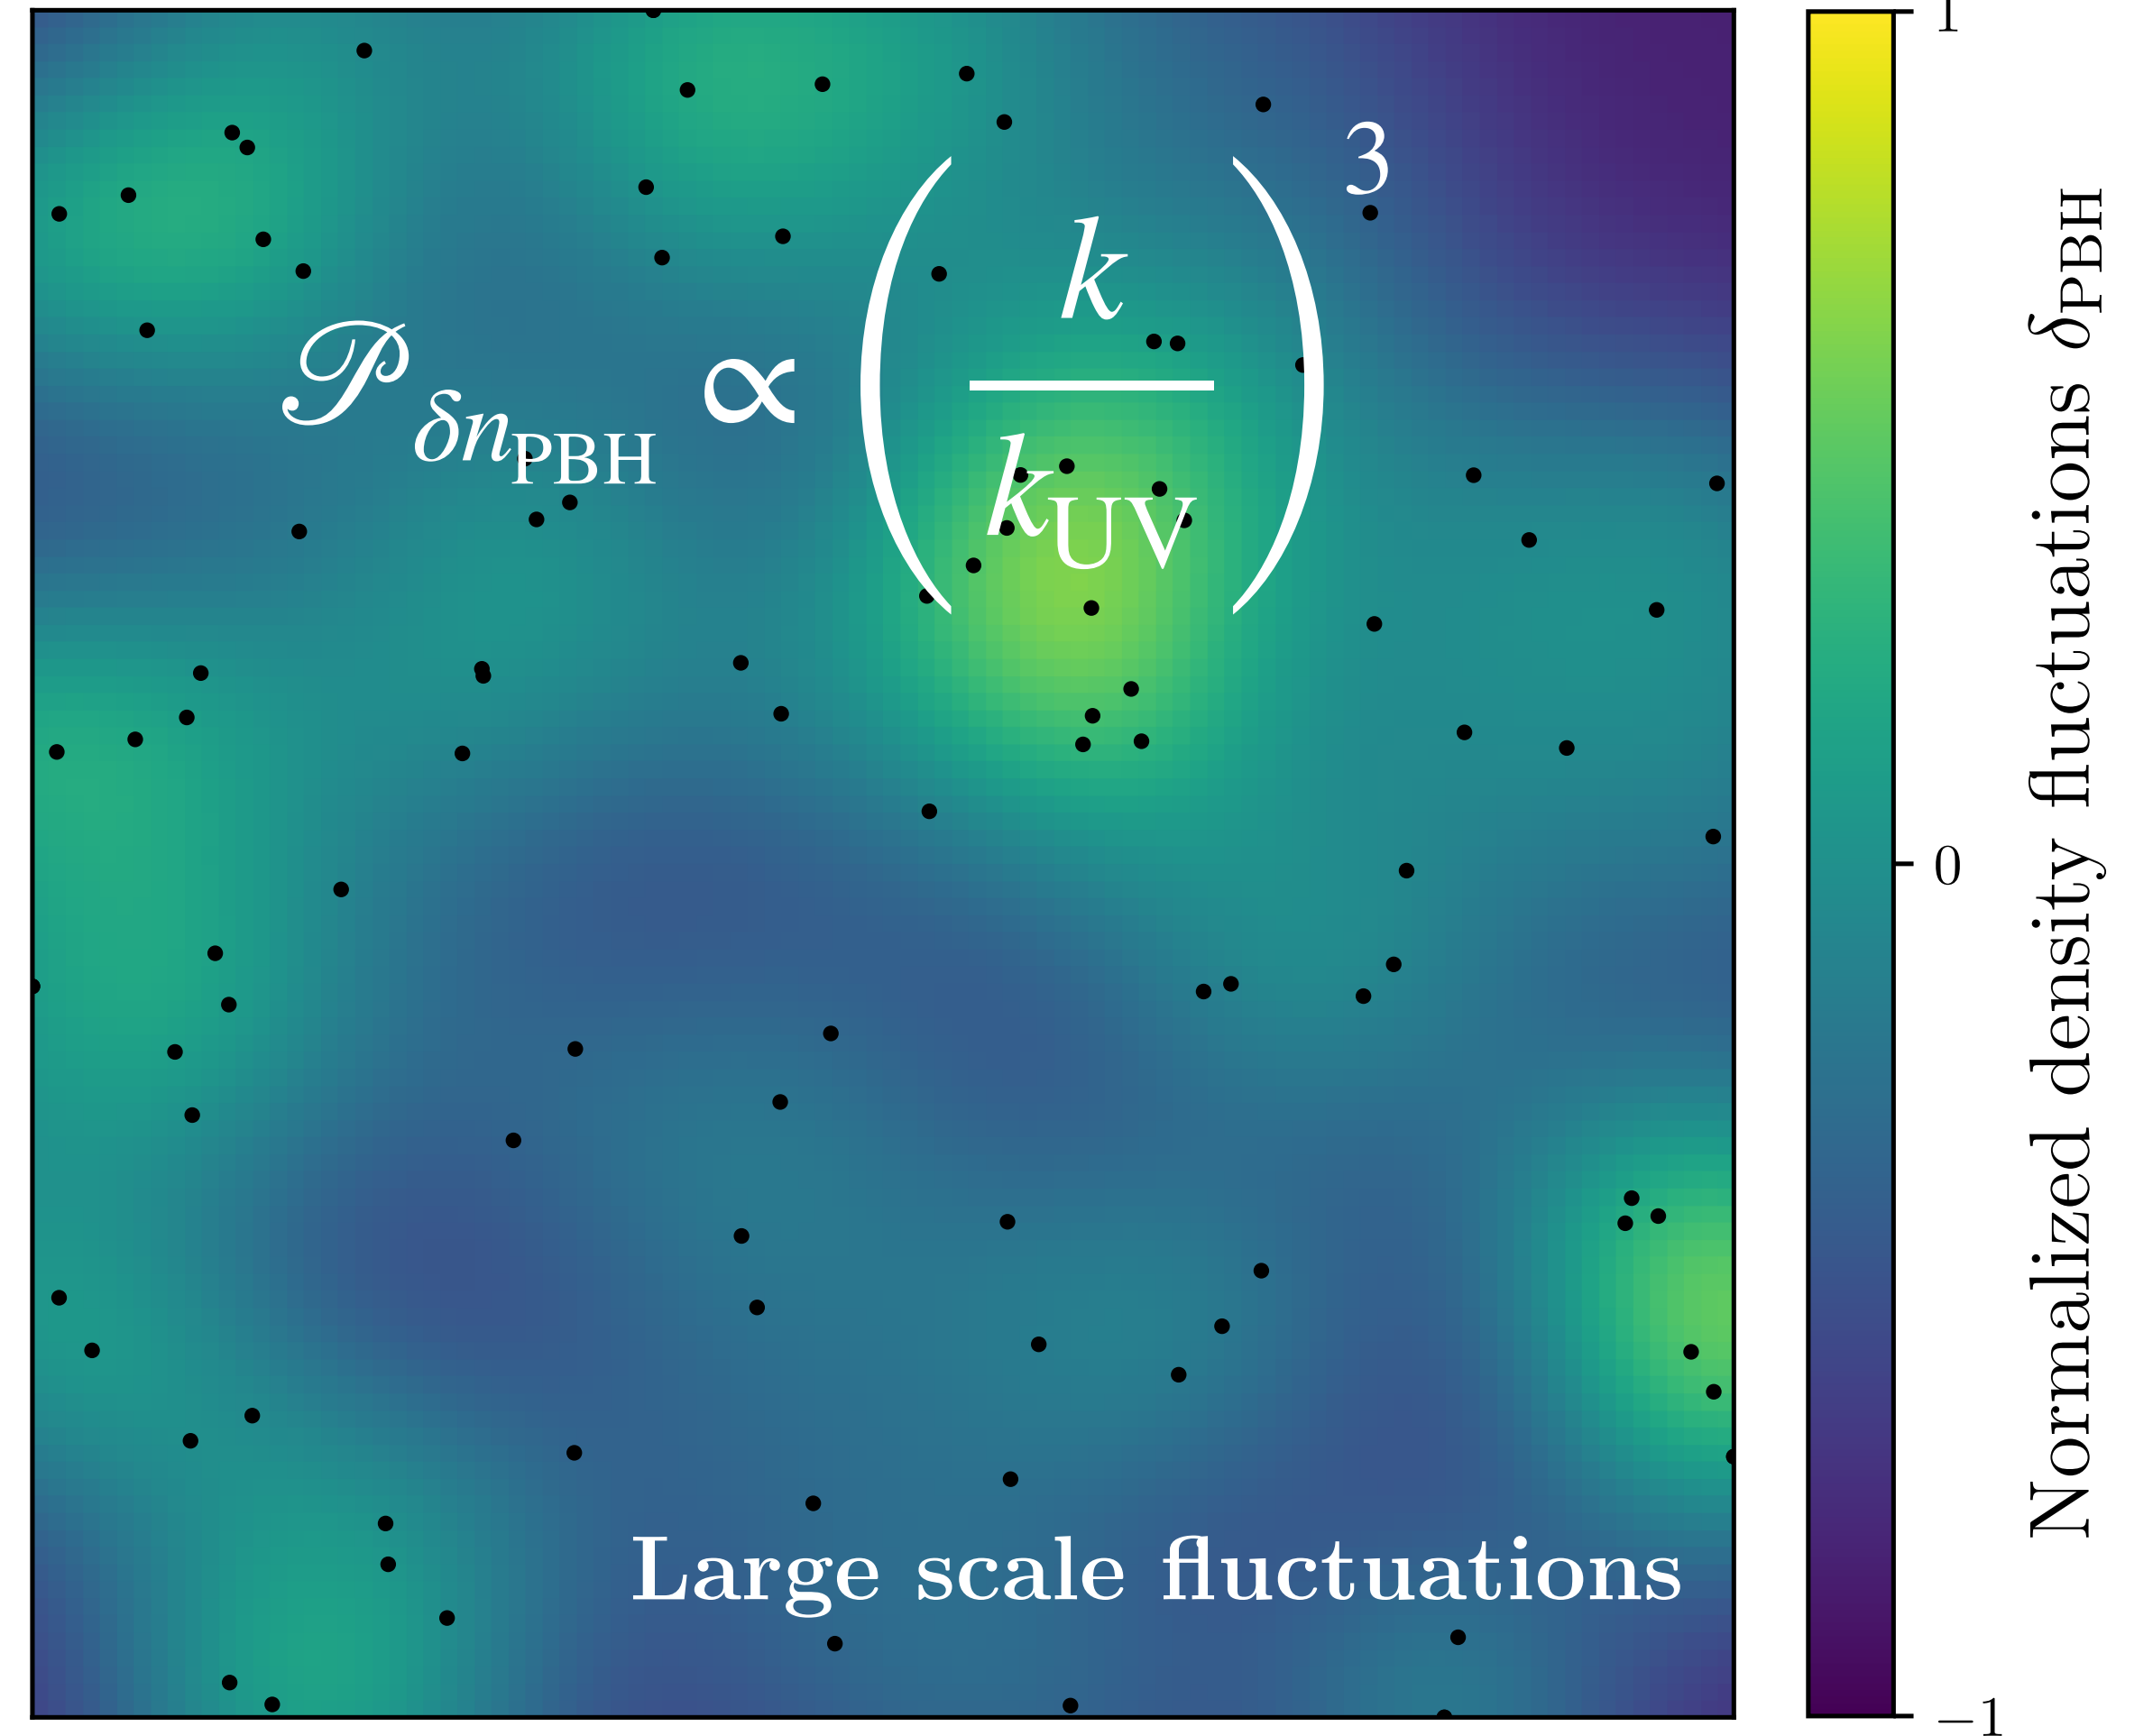

**How long until BH dominate?**  $R_{\text{eeq}} = t_{\text{eeq}}/t_f$

# PBH number density fluctuations

**Uniform, rare, random PBH formation**

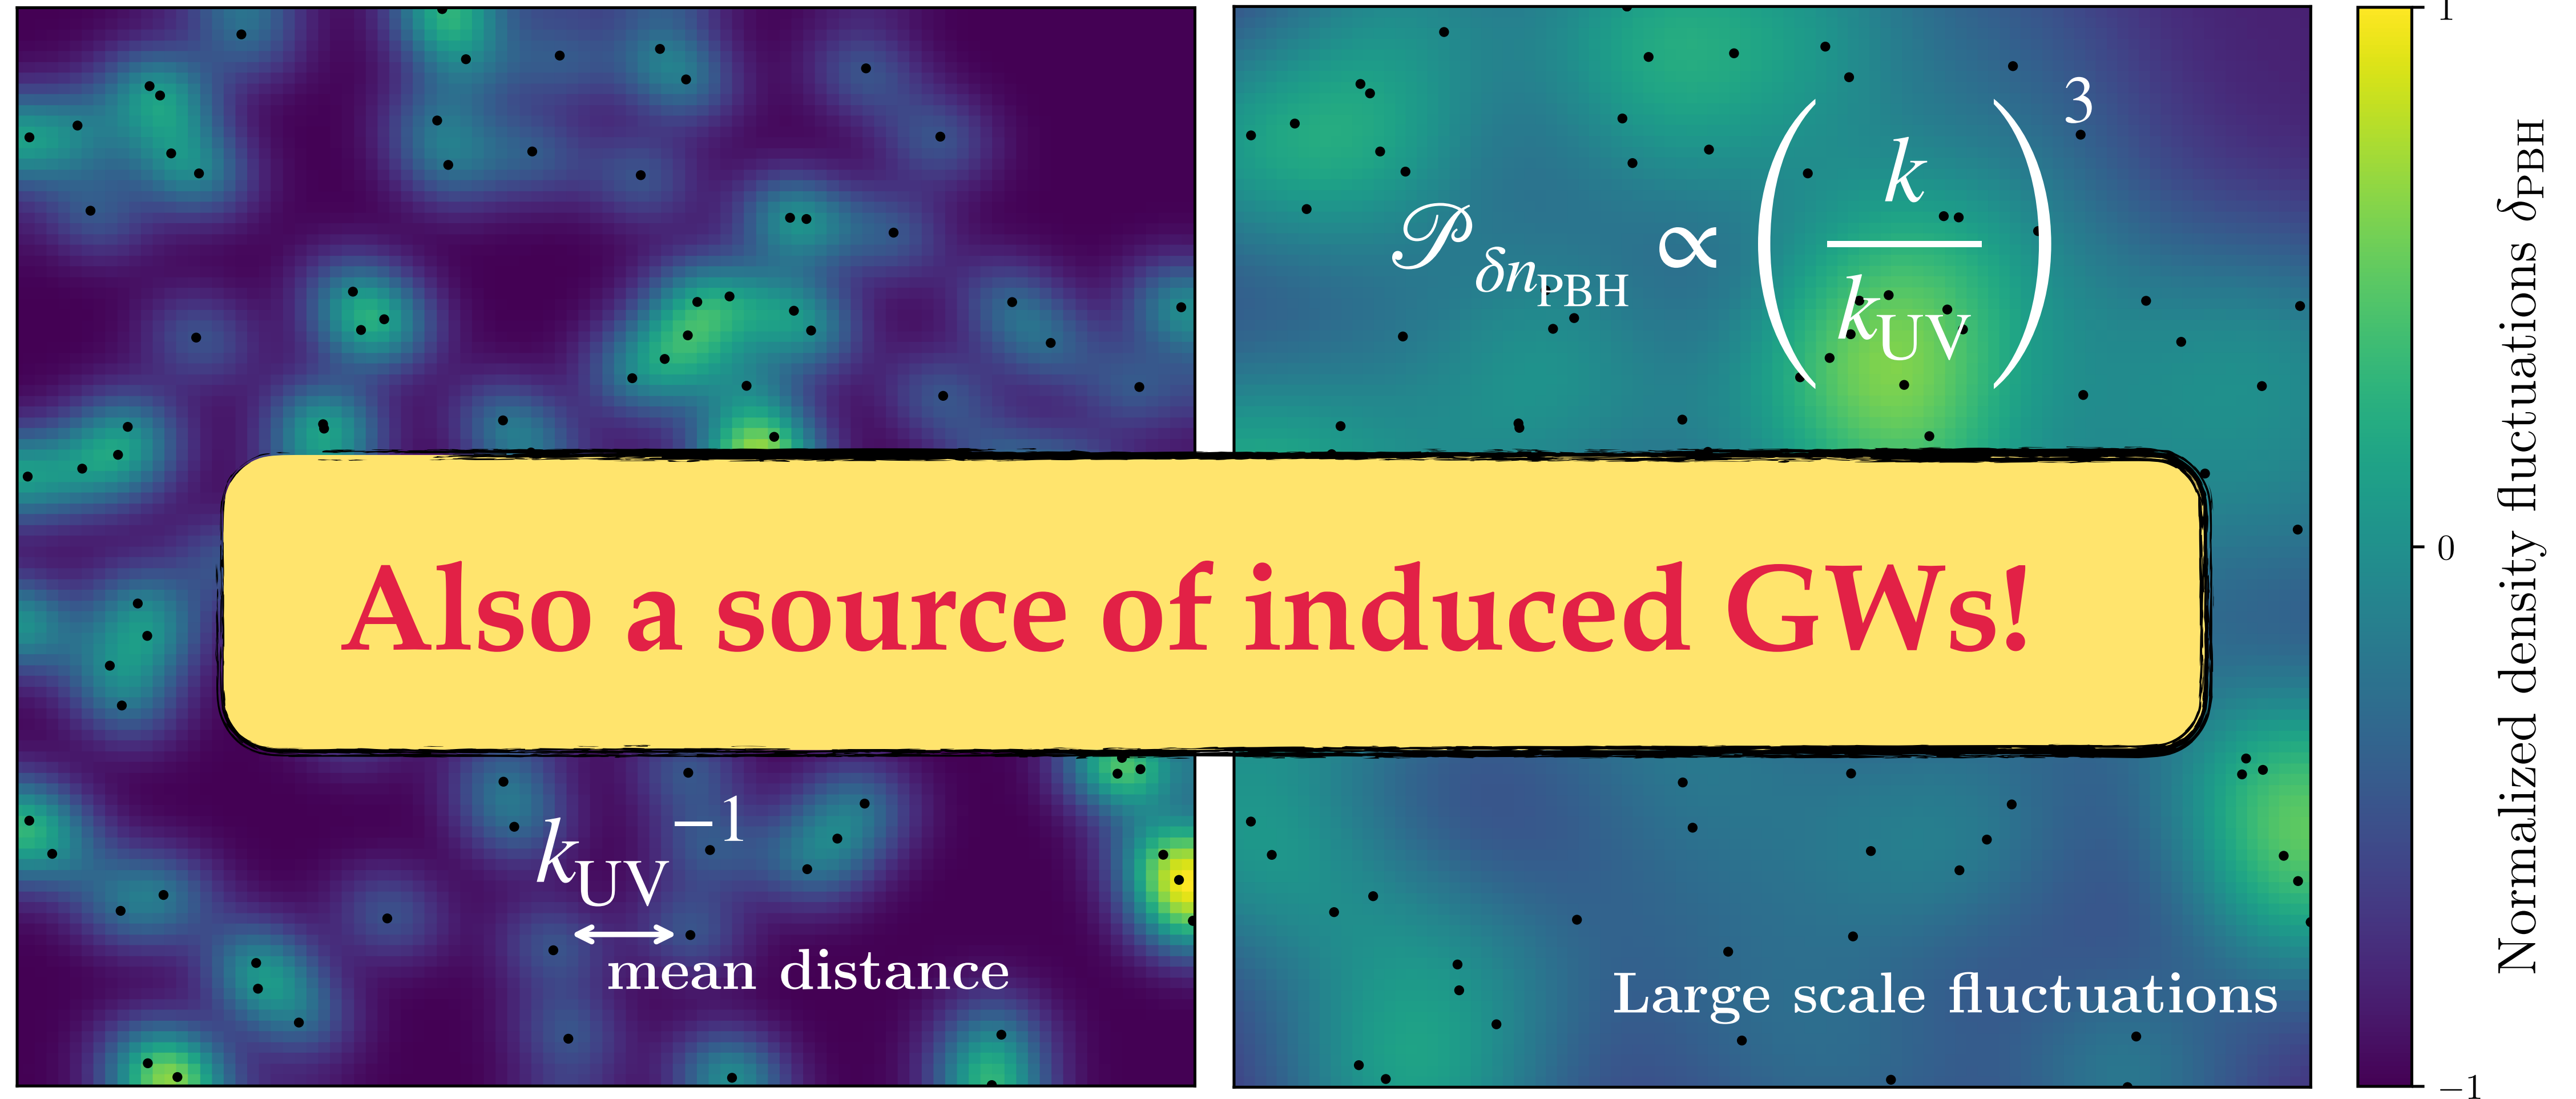

**Poisson fluctuations**

**Initial nature of fluctuations?**

# PBH number density fluctuations

Uniform, rare, random PBH formation

Poisson fluctuations

Initial nature of fluctuations?

# GWs from the PBH dominated early universe

$\log_{10}[X]$

# Initial conditions (review)

Definition: No initial curvature => Relative number density fluctuations

$$\Phi(k \ll \mathcal{H}) \sim \frac{\delta\rho_{\text{total}}}{\rho_{\text{total}}}$$

00-component Einstein Equations

$$\delta\rho_{\text{DM}} + \delta\rho_{\text{rad}} = 0$$

$$S = \frac{\delta\rho_{\text{DM}}}{\rho_{\text{DM}}} - \frac{3}{4} \frac{\delta\rho_{\text{rad}}}{\rho_{\text{rad}}}$$

E.g. initial CDM isocurvature  $\Phi_i = 0$

E.g. adiabatic initial conditions  $S=0$

Due to, e.g., extra fields during inflation or Primordial black hole formation

Constrained to be <10% on CMB scales but unconstrained on smaller scales

# Initial isocurvature from PBHs

Imagine a radiation dominated homogeneous universe...

Adiabatic and isocurvature fluctuations are evolve independently

# Initial isocurvature from PBHs

One Hubble patch collapses...

Collapse due to large adiabatic fluctuations

# Initial isocurvature from PBHs

And a black hole forms...

# Initial isocurvature from PBHs

If we look at fluctuations on coarse grained scales...

PBHs form randomly in space and yield density fluctuations

# Transfer to curvature

[T.Papanikolaou, V.Vennin, D.Langlois, 2010.11573]

Initial radiation domination with random PBHs

[GD, C.Lin, M.Sasaki, 2012.08151]

# Transfer to curvature

PBH energy density decays slower than radiation

**NOTE: The later a mode enters the horizon, the larger the curvature fluctuation induced**

# Transfer to curvature

We get a PBH dominated universe!

# The PBH dominated universe

$$t_f \approx \frac{1}{2H_f} \approx 10^{-8} \text{qs} \left( \frac{M_{\text{PBH},f}}{1 \text{ g}} \right)$$

$$t_{\text{eeq}} \sim \beta^{-2} t_f$$

$$t_{\text{eva}} \approx 400 \text{qs} \left( \frac{M_{\text{PBH},f}}{1 \text{ g}} \right)^3$$

# GWs from PBH density fluctuations

[K.Inomata+2003.10455]

[T.Papanikolaou+ 2010.11573]

[GD+2012.08151]

Sudden evaporation of all PBHs, creates huge velocity fluctuations in the radiation fluid

and a **loud GW signal!**

$$(\partial_t^2 + 3H\partial_t - \Delta)h_{ij} \sim \widehat{TT}_{ij}{}^{ab} (\partial_a V \partial_b V)$$

$$V \propto \Phi' / \mathcal{H}$$

**GWs induced in an early matter era  
get greatly enhanced for sudden reheating!**

[Inomata+1904.12878  
,1904.12879]

There also induced GWs  
during the PBH dominated era  
[T.Papanikolaou+ 2010.11573]

# GWs from PBH density fluctuations

[K.Inomata+2003.10455]

[T.Papanikolaou+ 2010.11573]

[GD+2012.08151]

Sudden evaporation of all PBHs, creates huge velocity fluctuations in the radiation fluid

and a **loud GW signal!**  $\Omega_{\text{GW}} \approx 10^{49} \beta^{16/3} \left( \frac{M_{\text{PBH}}}{10^9 \text{g}} \right)^{34/9}$   $f_{\text{uv}} \approx 4.4 \times 10^6 \text{ Hz} \left( \frac{M_{\text{PBH,f}}}{1 \text{g}} \right)^{-5/6}$

We can use it to test the PBH dominated universe:

(If PBH spin, we can combine info on  $N_{\text{eff}}$  [GD+2105.06816])

# Bonus: PBH Remnants

# What if Planck remnants remain?

Same picture as before + CDM component after evaporation!

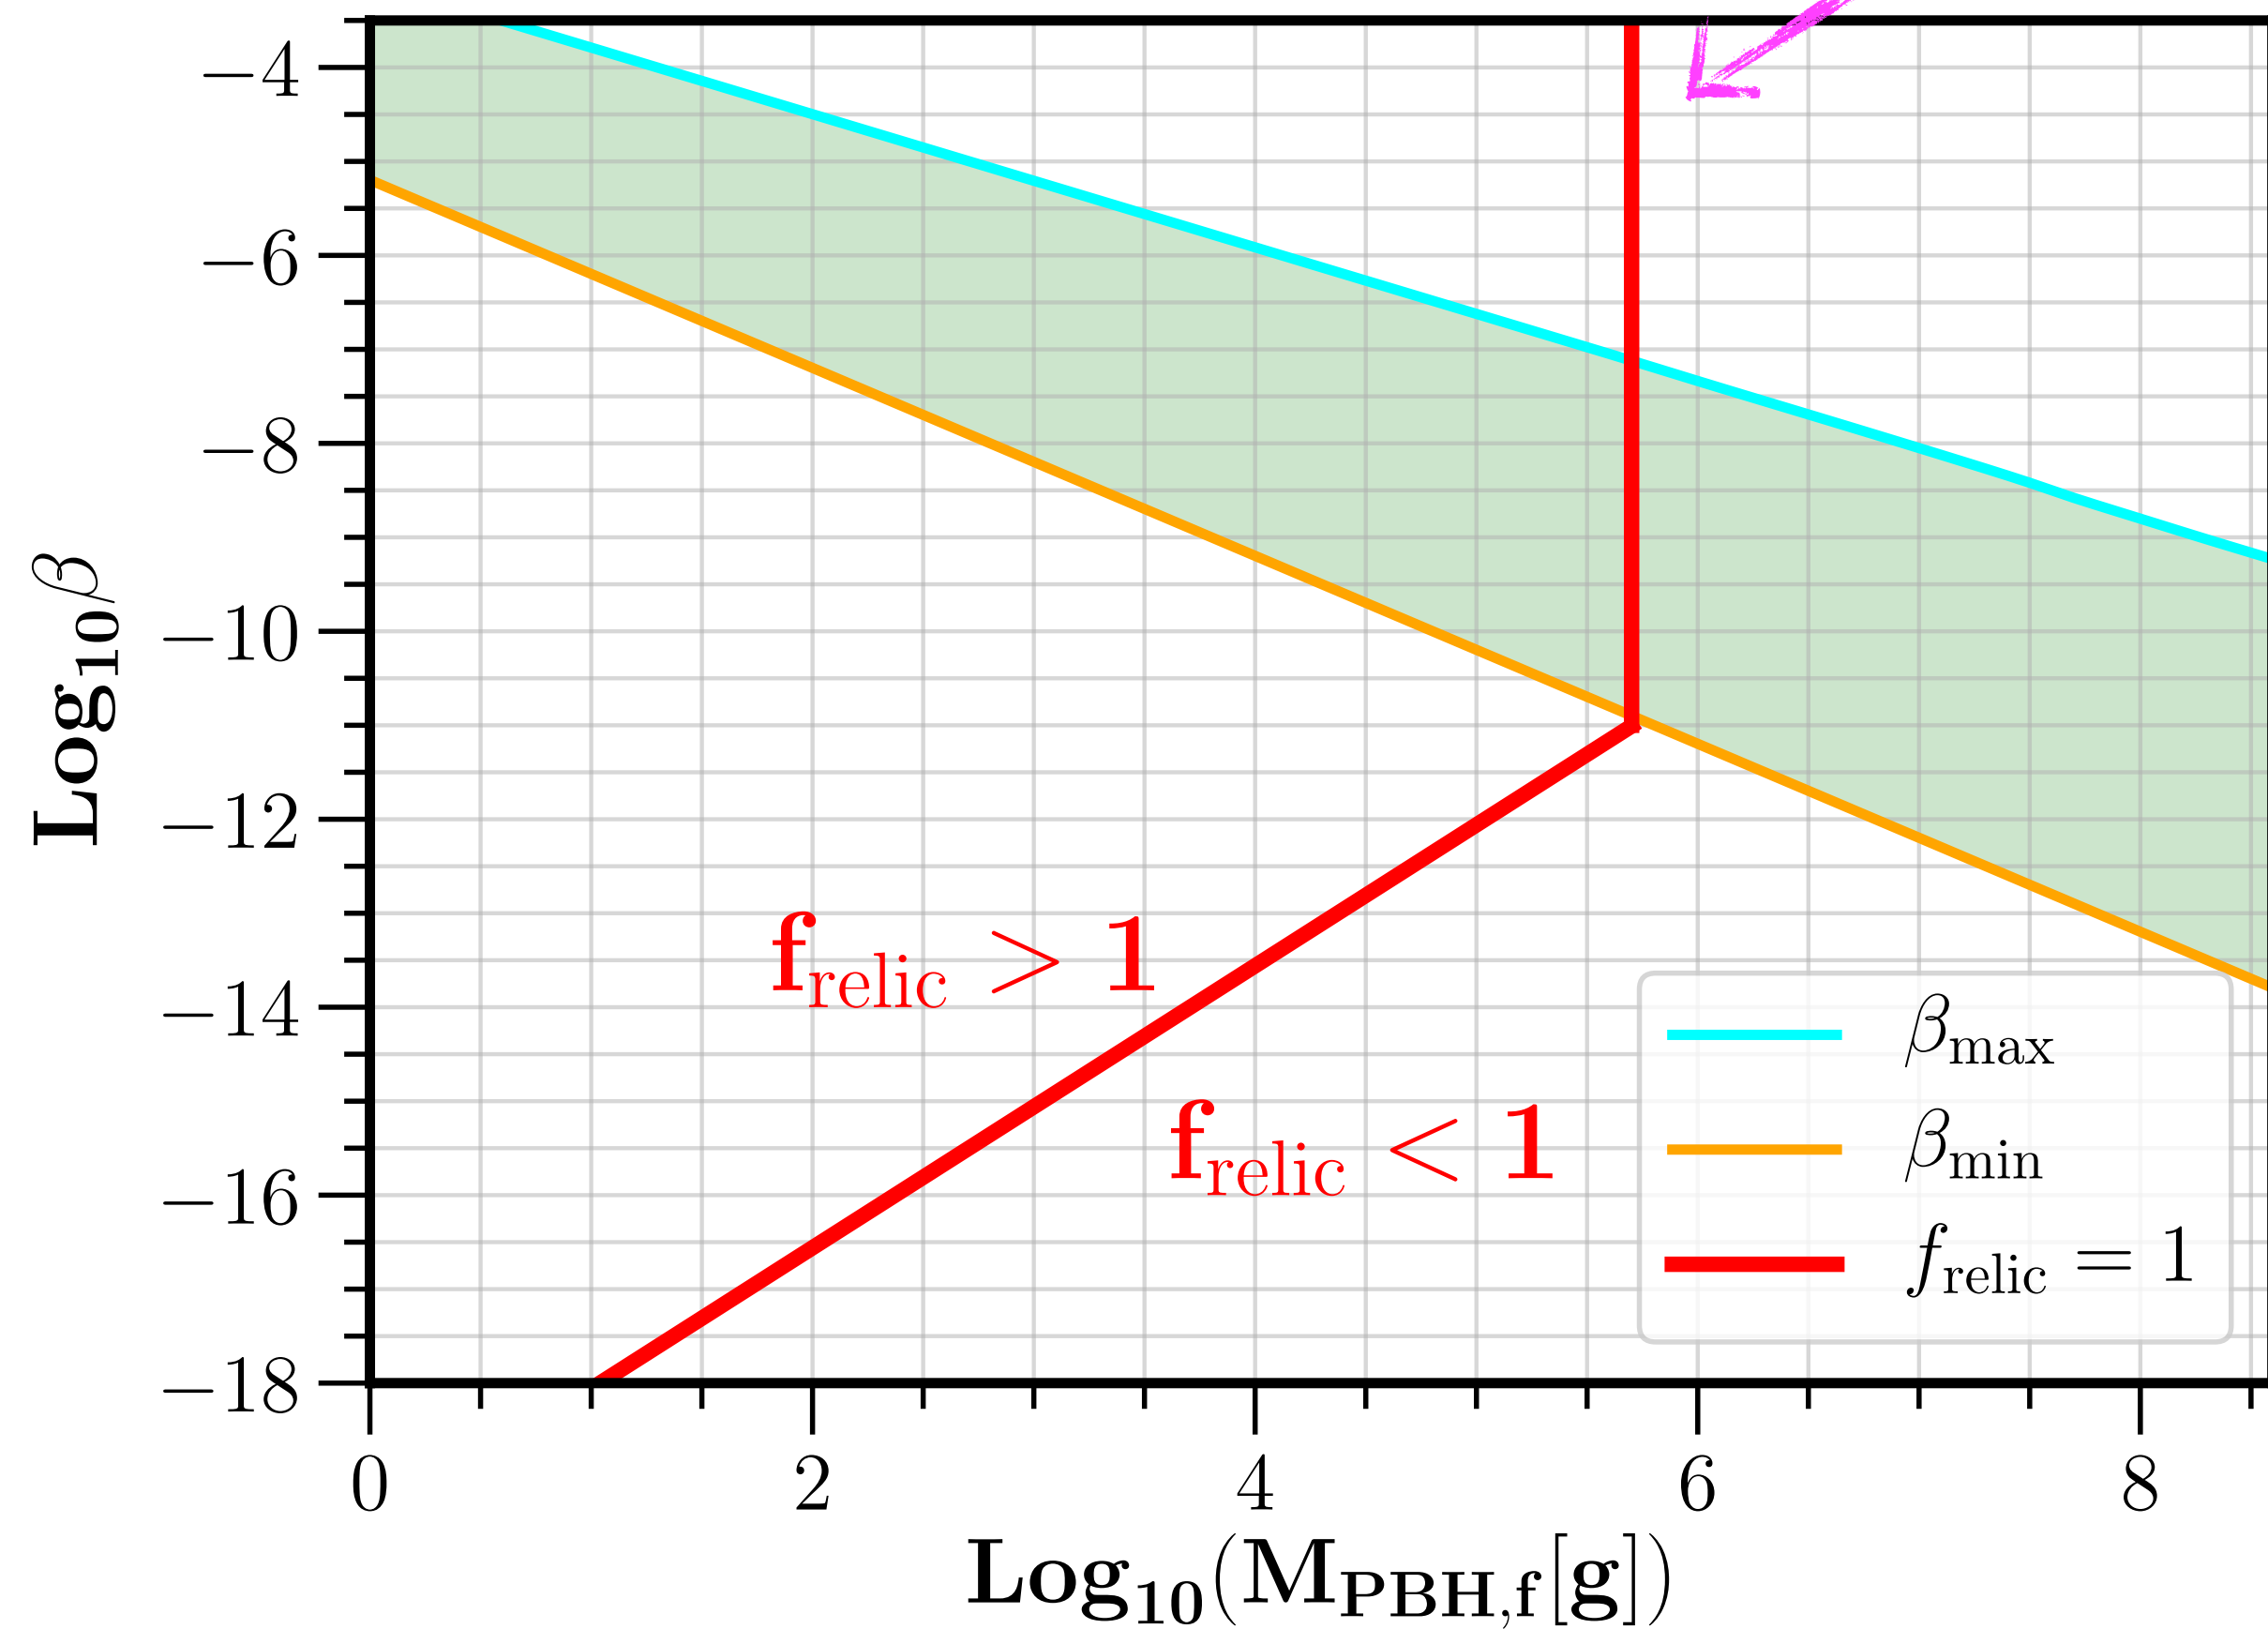

PBH remnants = Reheating + CDM

$$M_{\text{PBH},f} \approx 5 \times 10^5 \text{ g}$$

# What if Planck remnants remain?

$$f_{\text{relic}} = \rho_{\text{remnants}} / \rho_{\text{cdm}} \quad M_{\text{PBH},f} \approx 5 \times 10^5 \text{ g} \quad f_{\text{uv}} \approx 70 \text{ Hz}$$

# GWs from PBH density fluctuations (future work)

Most of PBH density fluctuations reach the non-linear regime during PBH domination

$$0.5 < \delta < 10^4 \left( \frac{M_{\text{PBH}}}{10^4 \text{g}} \right)^{7/18}$$

This means that there will be BH mergers.

However, production of GWs will not stop and we still have  $\Phi \ll 1$   
(so our estimate might be on the right track in orders of magnitude)

How the system behaves in the non-linear regime with PBH evaporation needs numerical work.

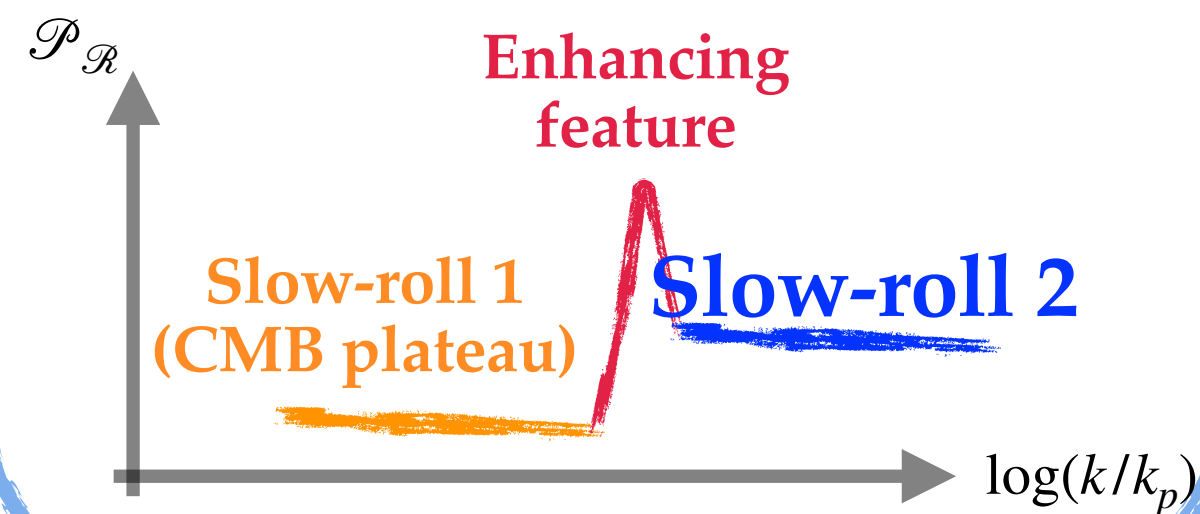

(maybe it generates turbulences? Kozaczuk et al. 2108.12475)

# Summary

*“Induced GWs and PBHs provide a unique opportunity to test the unexplored primordial universe”*

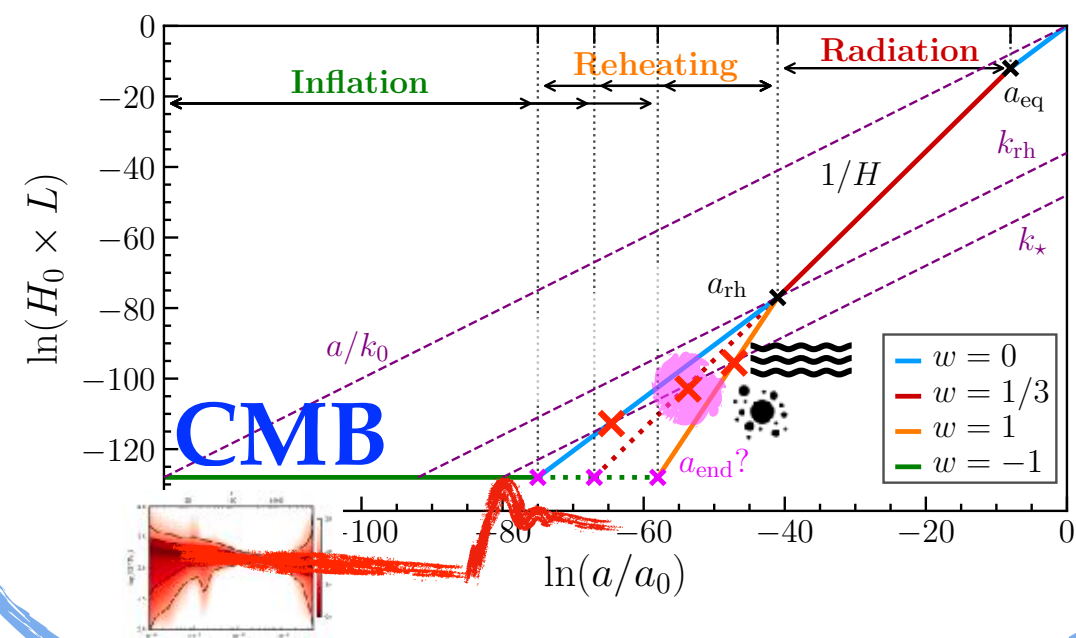

## Cosmic inflation

## Initial conditions

## Content of the universe

## GWB anisotropies

**+ We can test the PBH dominated universe and the PBH remnant scenario!**

$$M_{\text{PBH},f} \approx 5 \times 10^5 \text{ g}$$

$$f_{\text{UV}} \approx 70 \text{ Hz}$$
